I.Introduction

These days, job seekers frequently use online CV generator since they make it simple and quick to build a professional resume. These websites help users make their resumes stand out from the competition by offering a range of CV generation, customisation, and improvement choices. This project study aims to gather more data about online CV builders, their uses, and their consequences for software engineers.

1. Project Information

In the background, the primary objective of the project is to develop a website that makes it simple for users to produce, modify, and update resumes. This website is helpful since businesses prefer to view digital resumes and job seekers want to showcase their accomplishments and abilities in a distinctive and professional way. Second, the project aims to create a functioning, user-friendly website that can be tailored to suit different requirements. A broad spectrum of software engineering skills, such as problem-solving, system design, coding, testing, and result validation, will be required for this project. Ultimately, the goal is to create a website that satisfies users and adheres to the highest software design and development standards

2. Work Breakdown Structure

The structure of our project can be expressed in the **Figure 2.1:**

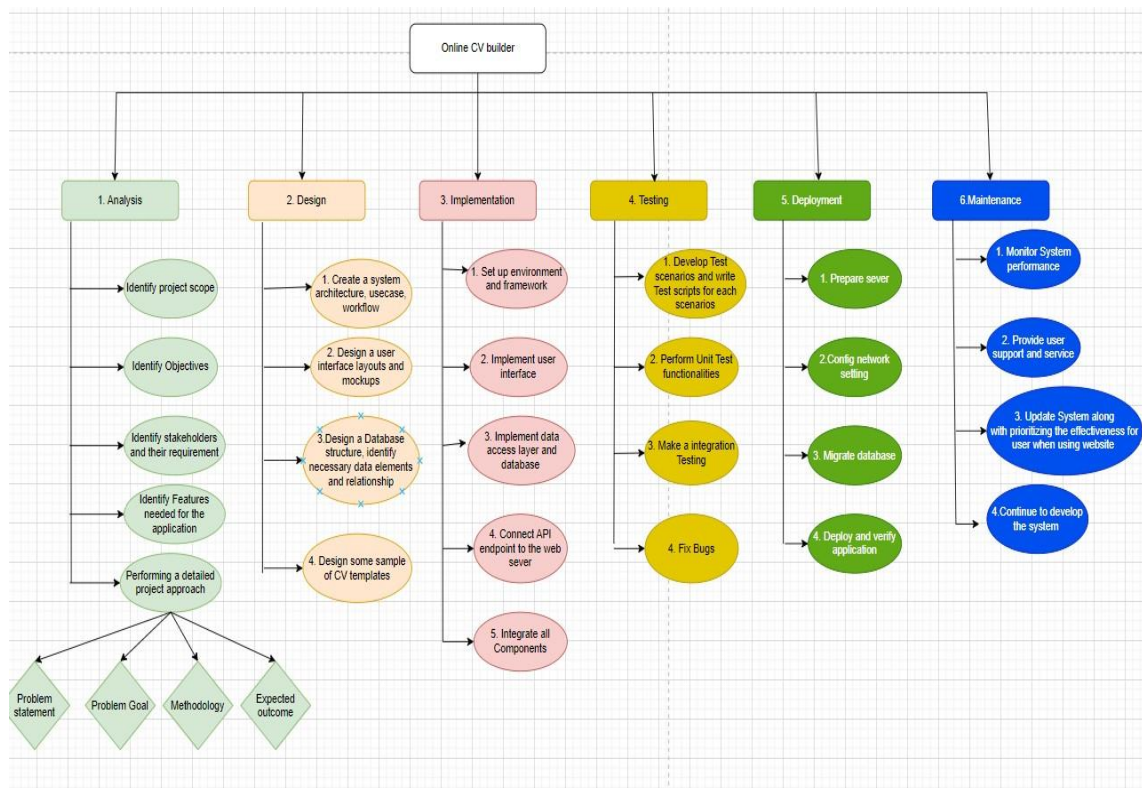

Figure 1.2.1 Work Breakdown Structure

Based on the work breakdown structure, our online CV builder project may be divided into six stages: analysis, design, implementation, testing, deployment, and maintenance:

- ◆ **Analysis:** Establishing the project's goals and scope, stakeholders' needs, and the online CV generator's features are all part of the analytical process. Because it is used to understand the direction of the project and the expectations of the stakeholders, the analysis is essential and needs to be completed at the very beginning.
- ◆ **Design:** By examining the system architecture, which comprises use cases and sequence diagrams, we may determine whether or not the design has been created during the design process. During the design phase, the necessary data pieces and links are specified, along with sample CV templates, and mockups of the user interface and database structure are also constructed. These components help to guarantee that the system satisfies the requirements of the stakeholders and act as a visual reference for the development team.
Implementation: Configuring the framework and development environment is part of the implementation stage. This step will primarily focus on developing the database, data access layer, and user interface. Regarding the APIs, which are connected to the web server, every part is combined to create a complete system. Additionally, the concept is transformed into a working software program at this point.
- ◆ **Testing:** To find out how the system functions and how its components interact, testing involves creating testing scenarios and conducting tests. A closer examination reveals that these tests confirm that everything functions as it should and that the system operates as planned. Furthermore, any issues or flaws discovered at this point will be tested and rectified before the system is made functional.
- ◆ **Deployment:** This stage involved setting up the network, moving the database, setting up the server and turning on the program. We have to make sure the program works as intended in the production setting throughout this phase. This phase, in summary, shows how the project moves from development to end-user deployment.
- ◆ **Maintenance:** During the maintenance phase, the system is updated, user support and service are provided, and system performance is monitored. The website's usability is given top priority, and the system is updated frequently to accommodate evolving user demands and technical developments.

3. Development Process

a. System's Workflow

The steps in the system workflow are as follows:

- +, The user will be on the home page at first. Now, the user has three choices: create their CV, look for CV templates, and log in or register. The system will continue to function as a Guest if users would rather Search CV and Create a CV without logging in or registering.
- +, The Search CV Template option enables the user to utilize the engine toolbar to search for the CV they desire. The toolbar's purpose is to filter the user's entered keywords and display CV templates that match their keyword requirement. They can change the CV and save it to their shop after choosing a template (the system will ask them to log in to their account first).
- +, In the "Get Started" option, the system takes the user to a website where they can fill in the blanks in the CV template requirements which they can still process as a Guest. Once the user has completed filling out the CV up to the final stage, they may

evaluate the CV they just made. The user may update the resume, store it in their account, and download it after they have finished checking in and paying the download charge.

+, In the “CV stored” option: It requires the user to have an account and login first, then it will move the user to their account storage where they can find their Saved CV. The saved CV can be modified or used again by the user before downloading.

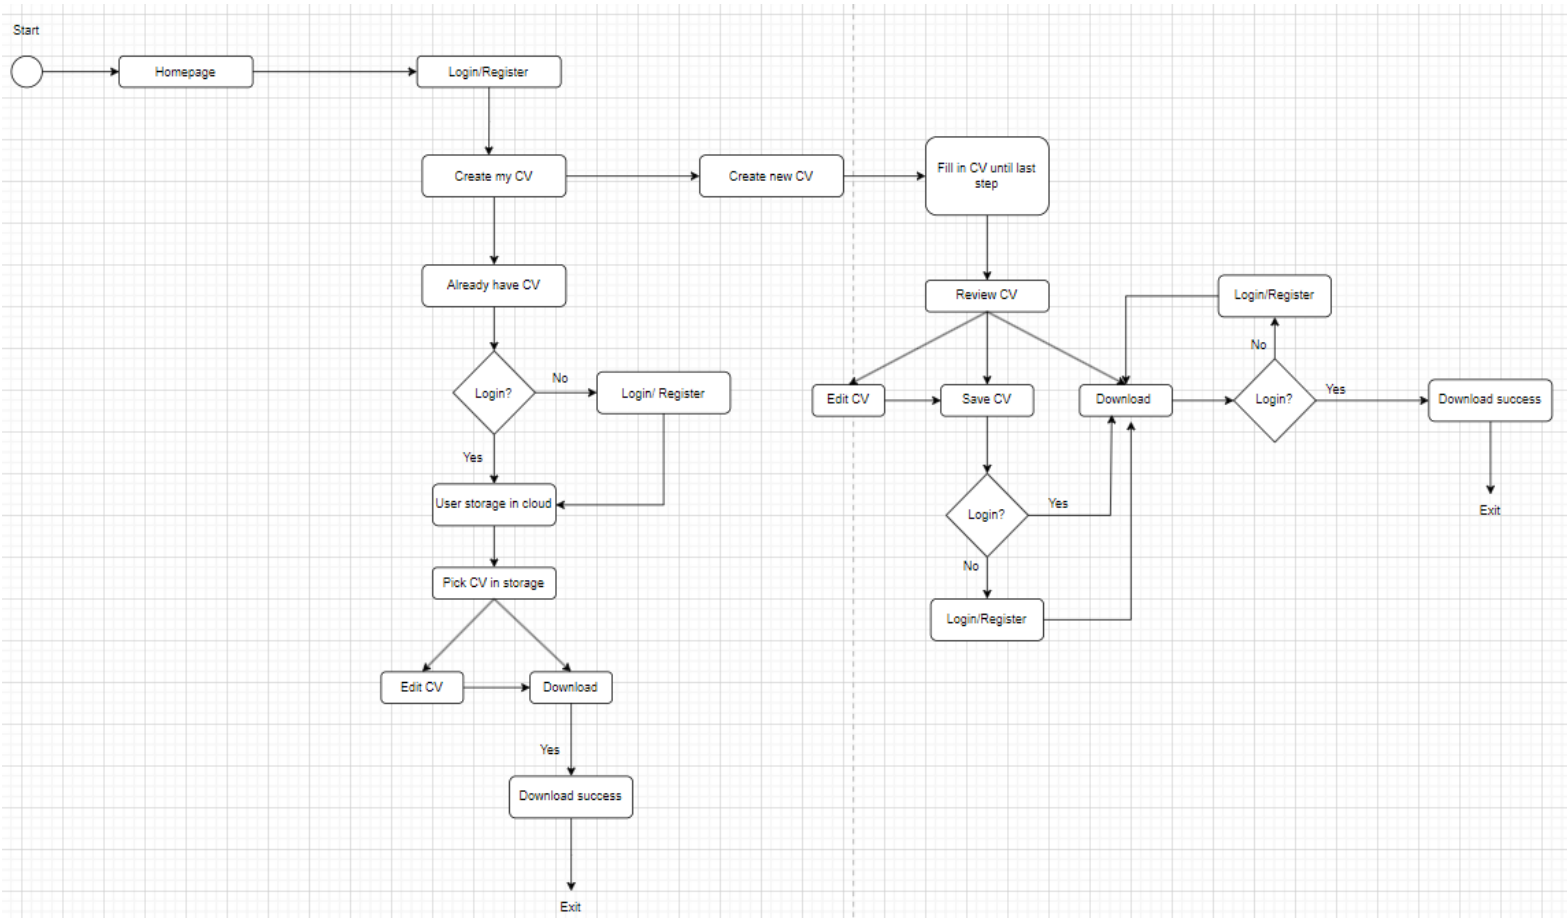

Figure 1.3.2 System Workflow

4. Development Environment

Our project software is built applying the following technologies:

As for Front-end:

- **HTML:** We implemented HTML for structuring the content of the web pages such as headings, paragraphs, images, etc. It also makes the elements of the website to be more arranged
- **CSS:** We implemented CSS for styling and layout of the web pages, such as colors, fonts, margins, padding, borders, etc. It applies rules to the html element to control their appearance and positions.
- **Javascript:** We've used JavaScripts to make our web pages interactive, responding to user events, changing HTML elements, and making backend calls. Moreover, We've also used libraries and frameworks to enhance its functionality and simplify our code.

- **Figma:** Initially, we intended to use Figma as website to design our images and export CSS and HTML code. However, we found that the code did not meet our requirements and had some font and text bugs when running, so we only used it code as a reference when creating CV templates.

As for Back-end:

- We use **API** (application programming interface) to set up a connection between clients and server to communicate for response and request (as json file) to get, post, update, delete data
- Framework **Spring boot** for:
 - + Rapid development (auto-configuration, embedded servers)
 - + RESTful Web Services (@RestController annotation and HTTP methods (GET, POST, PUT, DELETE)
 - + Dependency Management (starter web, data jpa, lombok, mysql,...)
 - + Database integration (easy integration using spring data jpa/jdbc via resources/application.properties)
 - + Testing (starter test to boot, test for database access,...)

II. Requirement Analysis and Design

1. Requirement Analysis

a. Use case Diagrams

Use case Diagram for the whole software:

Use Case: Online CV Builder

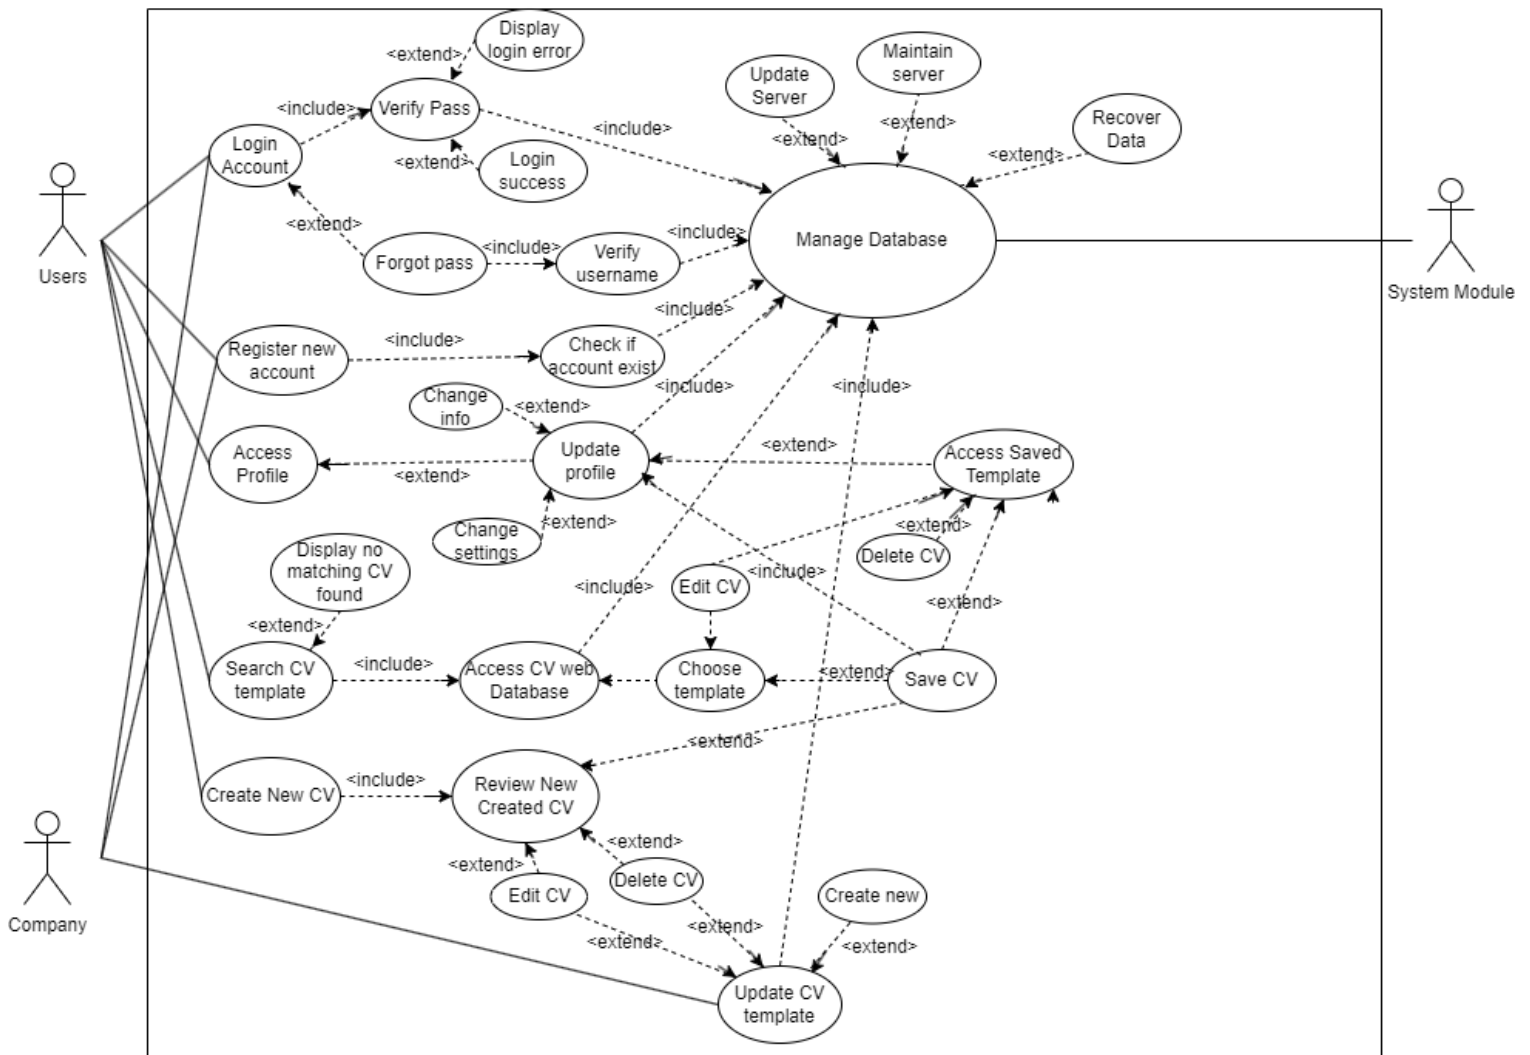

Figure 2.1.1: Use Case Overall System

Use Case Login, Register, Forgot password

- **User Story:** After accessing the website homepage, Users have to input their username and password to the Login screen(which is also applied to the Systemmanagerandcompany). In the User and Company Case, If they are new to the website, they must Register a new account before accessing the software. After the User finishes creating a CV choose the CV template to save and successfully download. Then they can now logout the website. If the User Forgot the password, the system gives them a way to get their password back.

- Use case diagram:

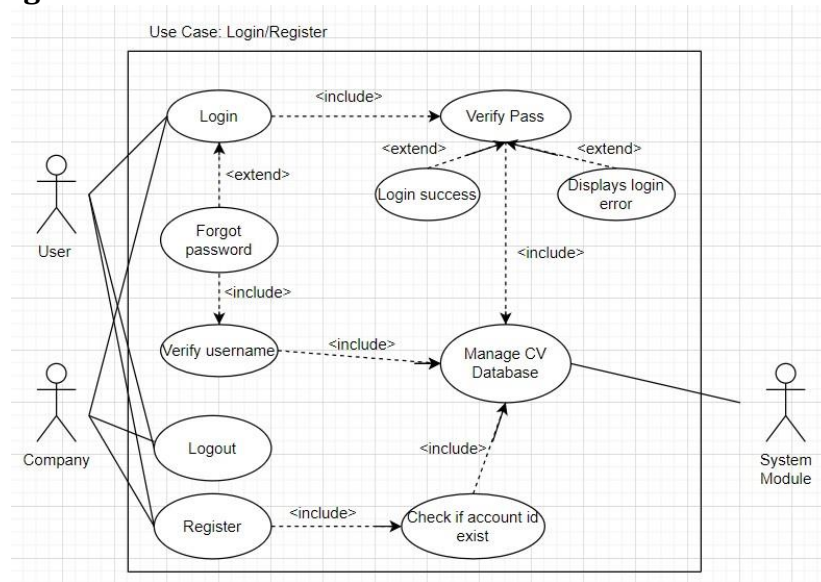

Figure 2.1.2: Use Case Login/Register

- Use case using a table format:

Table 1: Use Case table for Login/Registration

Use case name:	Use Case Login/Register		
Created by:	Pham Dang Quang	Last updated by:	Pham Dang Quang
Date created:	13/10/2024	Date last updated:	15/10/2024
Actors:	Users, Company		
Description:	Users create an account; login to the existing account or create a new password		
Preconditions:	<ul style="list-style-type: none"> User access to the software User needs to have Internet 		
Postconditions:	<ul style="list-style-type: none"> Always update the company template 		

Normal Flows:	<ol style="list-style-type: none"> 1. User login to an already existing account by verifying the password. 2. User logs into an already existing account. 3. The user creates a new account and checks the account ID. 4. The System Module manages the CV database.
Alternative Flows:	<ol style="list-style-type: none"> 1.1 Verify the account. 1.2 Login success. 1.3 Display there is an error when logging in or the wrong password. 1.4 The account exists and the User forgot the password, Recipating a new password needs to verify the info of the account and access to the database.

Use Case Search CV Templates

- **User Story:** The Users are allowed to use the search engine without login to look for CV templates after visiting the homepage of the website. On the search engine, Theuser has to input certain keywords into the search engine,the system now scans for matching keywords on the CV template and moves Users to the Search Results page. On the Search Result page, If the system finds a matching CVs keyword, it will display CV Templates that meet the user's needs. Otherwise, will display nothing. Whenever users find the template they want, they can edit it, save it to their account storage, and download it.
- **Use case diagram:**

Description:	Users can access the software to Save and Download the CV.		
Preconditions:	<ul style="list-style-type: none">• User access to the software• User needs to have Internet		

	<ul style="list-style-type: none"> User needs to choose the requirements document template
Postconditions:	<ul style="list-style-type: none"> Always update the template
NormalFlows:	<ol style="list-style-type: none"> Users review the new CV which is created by them. The System Module needs to update the Database to Announce themessage.
Alternative Flows:	<ol style="list-style-type: none"> 1.1 Users can update their CVs and review them again. 1.2 Users pressthe download button. 1.3 Display the download successfully
Exceptions:	
Noteandissues:	

b. Functional Requirement

- The system must authenticate user login credentials.
- The system must allow users to input CV information.
- The system must generate a new CV based on user input and a CV Template.
- The system must be able to store new CVs in the Database.
- The system must allow users to input keywords to search/filter criteria.
- The system must retrieve matching CVs from the CV Database based on users input.
- The system must allow users to access the CV template after searching to edit, save, and download.
- The system must allow users to save CVs to their UserStorage.
- The system must allow users to download CVs

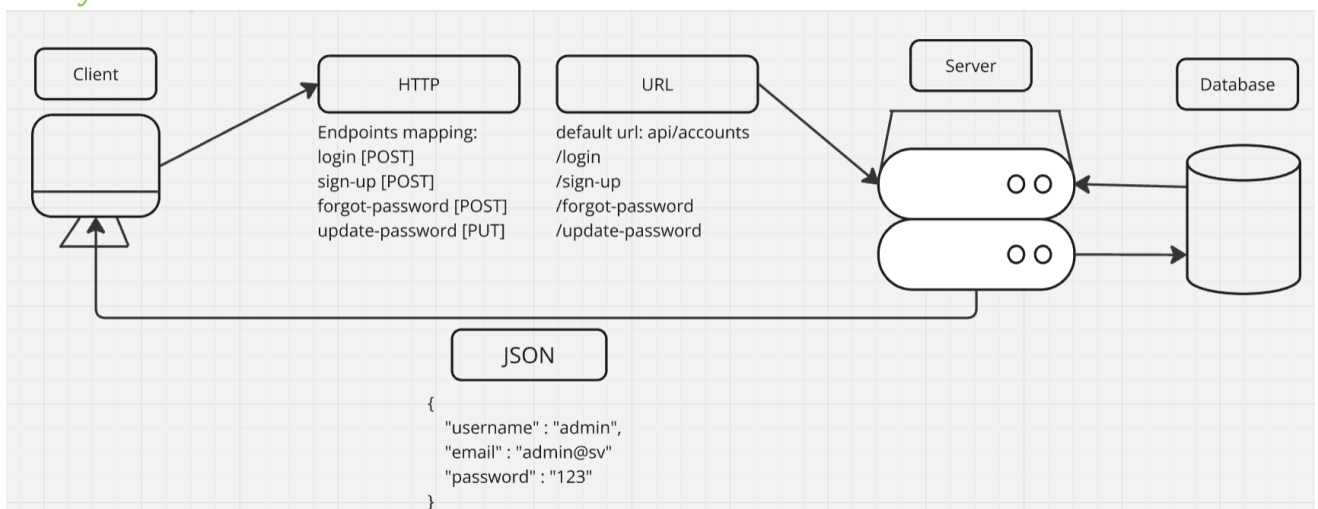

c. Non-Functional Requirement

- **Usability Requirements:**

- The system should have an intuitive and user-friendly interface.
- The system should provide clear instructions to the user.
- **Performance Requirements:**
 - The system should be able to handle multiple simultaneous users without performance degradation.
 - The system should have a response time of less than 5 seconds for all operations.
 - The system should be available 99.9% of the time.
- **Space Requirements:**
 - The system should efficiently manage storage to accommodate a large number of CVs.
 - The system should provide options for storage expansion.
- **Dependability Requirements:**
 - The system should be reliable and produce consistent results.
 - The system should have a backup mechanism to prevent dataloss.
- **Security Requirements:**
 - The system should encrypt sensitive user data.
 - The system should have measures to prevent unauthorized access.
- **Environmental Requirements:**
 - The system should be compatible with various operating systems and browsers.
 - The system should be responsive and adaptable to various screensizes.
- **Operational Requirements:**
 - The system should require minimal maintenance.
 - The system should provide easy trouble shooting and error handling.
- **Development Requirements:**
 - The system should be developed using a modular approach for easy updates and modifications.
 - The system should follow coding standards and best practices for maintainability.

2. Design

a. System API Model

The client uses http through APIs and urls already linked in the front end to send Http posts, upload them to the server, from there the server returns the json files, get the json file and display it on the

front end.

b. Entity-Relationship Diagram

c. Sequence Diagram

- Diagram manages User Login-Register-Forgot Password:

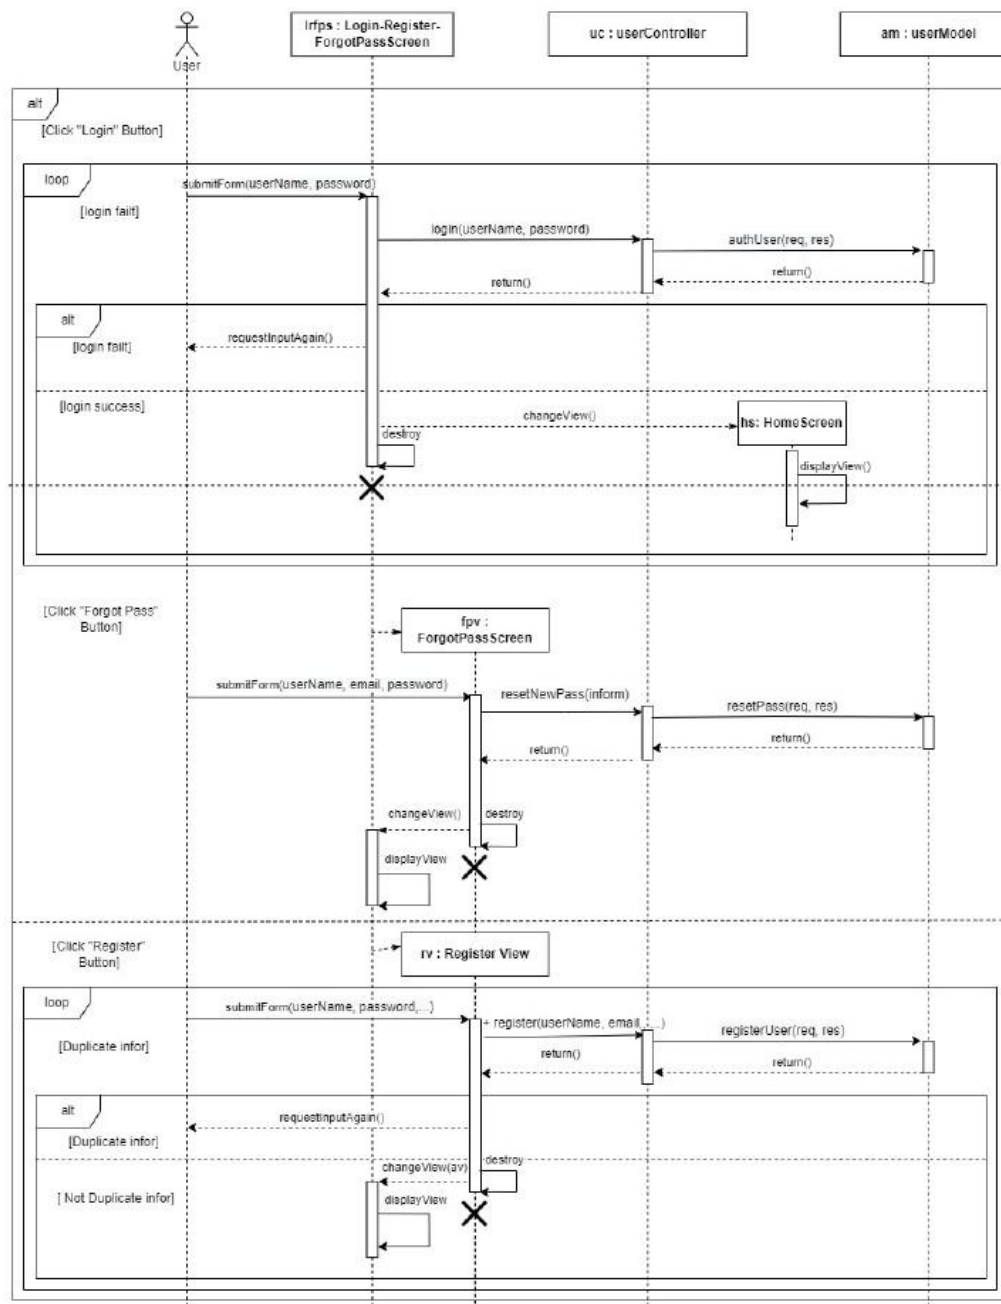

Figure11:SequenceDiagramLogin/Register/Forgotpassword

IV. DISCUSSION AND CONCLUSION

Through out this project, we have accomplished some achievements:

- We have created an online CV builder that allows users to create and download customized CVs in PDF format.
- Not only we have included templates, sections, fields, fonts, colors, previews, and downloads in the online CV builder software. But also we have incorporated animations into the website to make it look more professional.

However, Our software still has many limitations and features that need to be improved, such as:

- Our online CV builder only supports PDF format, which may not be compatible with some online platforms or systems. We can only improve this by adding other formats, such as DOCX, HTML, or TXT. This is due to the lack of time for us to cover all the features to the fullest.

- Our online CV builder only offers a few templates and options, which may not meet the preferences and requirement of some users. Furthermore, the templates are still basic, which may not meet many Users' needs in real life. To solve this, we need to add more templates and options, such as layouts, styles, icons, or images in the future.
- Our online CV builder only works online, which may not be accessible or convenient for some users if their connection is interrupted while they are editing.

We intend to expand our CV builder's functionality in the future by adding more customization choices and the capacity to save and download resumes in other formats. Based on customer input, we also hope to enhance the user interface. To turn this project into a business website in the future, we will also include payment facilities.

In summary, we have developed an online CV Builder that enables users to generate and save customized resumes in PDF format. From the project strategy to system analysis and design and execution, we have followed software engineering principles and practices. In the Implementation section, we also demonstrated the features and capabilities of our online CV maker.
